# **PRECAUTION**

## **PRECAUTIONS**

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

CO

Α

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the "SRS AIR BAG" and "SEAT BELT" of this Service Manual.

D

#### **WARNING:**

 To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.

E

Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Baq Module, see the "SRS AIR BAG".

G

 Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

Н

#### **WARNING:**

· When working near the Air Bag Diagnosis Sensor Unit or other Air Bag System sensors with the ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.

· When using air or electric power tools or hammers, always switch the ignition OFF, disconnect the battery, and wait at least 3 minutes before performing any service.

Precaution Necessary for Steering Wheel Rotation After Battery Disconnect INFOID:0000000004956916

NOTE:

This Procedure is applied only to models with intelligent Key system and NATS (NISSAN ANTI-THEFT SYS-

 Remove and install all control units after disconnecting both battery cables with the ignition knob in the "LOCK" position.

For models equipped with the Intelligent Key system and NATS, an electrically controlled steering lock mechanism is adopted on the key cylinder.

For this reason, if the battery is disconnected or if the battery is discharged, the steering wheel will lock and steering wheel rotation will become impossible.

If steering wheel rotation is required when battery power is interrupted, follow the procedure below before starting the repair operation.

**OPERATION PROCEDURE** 

1. Connect both battery cables.

NOTE:

Supply power using jumper cables if battery is discharged.

2. Use the Intelligent Key or mechanical key to turn the ignition switch to the "ACC" position. At this time, the steering lock will be released.

Disconnect both battery cables. The steering lock will remain released and the steering wheel can be rotated.

4. Perform the necessary repair operation.

5. When the repair work is completed, return the ignition switch to the "LOCK" position before connecting the battery cables. (At this time, the steering lock mechanism will engage.)

CO

C

D

E

G

Н

M

Ν

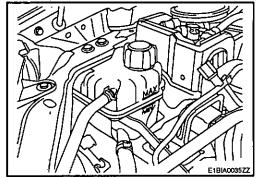

Р

#### LEVEL

- Check if the reservoir tank engine coolant level is within the "MIN" to "MAX" when the engine is cool.
- · Adjust the engine coolant level as necessary.
- Check that the reservoir tank cap is tightened.

#### WARNING:

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

#### **LEAKAGE**

 To check for leakage, fit the adapter to the reservoir tank, and then connect it to the reservoir tank cap tester [SST: — (M.S.554-07)] (A) as shown.

Testing pressure: Refer to CO-23, "Radiator".

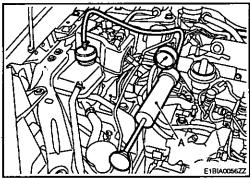

#### **WARNING:**

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

#### **CAUTION:**

Higher test pressure than specified may cause radiator damage.

If anything is found, repair or replace damaged parts.

## Draining

#### WARNING:

- Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.
- Wrap a thick cloth around the reservoir tank cap. Slowly turn it a quarter of a turn to release built-up pressure. Then turn it all the way.
- Disconnect radiator hose (lower) and reservoir tank cap.

When draining all of engine coolant in the system, open water drain plugs on cylinder block. Refer to EM-94, "Exploded View".

#### **CAUTION:**

- Perform this step when engine is cold.
- Never spill engine coolant on drive belt.
- 2. Remove reservoir tank if necessary, and drain engine coolant and clean reservoir tank before installing. Refer to CO-13, "Exploded View".
- 3. Check drained engine coolant for contaminants such as rust, corrosion or discoloration. If contaminated, flush the engine cooling system. Refer to CO-10, "Flushing".

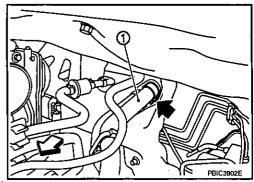

## Refilling

INFOID:000000004899437

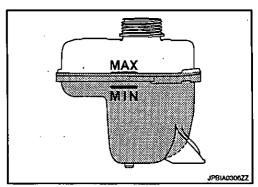

INFOID-0000000004899438

- 1. Install reservoir tank if removed.
- Connect radiator hose (lower).
  - If water drain plugs on cylinder block are removed, close and tighten them. Refer to <u>EM-94, "Exploded</u> View".
- 3. Check that each hose clamp has been firmly tightened.

- Disconnect heater hose (1) at position ( in the figure.
  - : Vehicle front
  - Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

- Fill reservoir tank to specified level.
  - Pour coolant slowly of less than 2 ℓ (1-3/4 Imp qt) a minute to allow air in system to escape.
  - When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.
  - Start engine without closing reservoir tank cap.
  - Keep engine racing at 1,500 rpm for about 2-3 minutes, filling reservoir tank up to MAX. Level, if necessary.
  - Use Genuine NISSAN Engine Coolant or equivalent mixed with water (distilled or demineralized). Refer to MA-13, "Fluids and Lubricants".

**Engine coolant capacity** 

(With reservoir tank at "MAX" level)

Refer to CO-23, "Periodical Maintenance Specification".

Reservoir tank engine coolant capacity (At "MAX" level)

Refer to: CO-23, "Periodical Maintenance Specification".

- 6. Install reservoir tank cap.
- 7. Warm up engine until opening thermostat. Standard for warming-up time is approximately 10 minutes at 2,000 2,500 rpm.
  - Check thermostat opening condition by touching radiator hose (lower) to see a flow of warm water.
     CAUTION:

Watch water temperature gauge so as not to overheat engine.

- 8. Stop the engine and cool down to less than approximately 50°C (122°F).
  - · Cool down using fan to reduce the time.
- Refill reservoir tank to "MAX" level line with engine coolant, if necessary.
- 10. Repeat steps 6 through 9 two or more times with reservoir tank cap installed until reservoir tank level no longer drops.
- 11. Check cooling system for leaks with engine running.
- 12. Warm up the engine, and check for sound of engine coolant flow while running engine from idle up to 3,000 rpm with heater temperature controller set at several position between "COOL" and "WARM".
  - · Sound may be noticeable at heater unit.
- Repeat step 12 three times.
- 14. If sound is heard, bleed air from cooling system by repeating step 6 through 9 until reservoir tank level no longer drops.
- 15. Check that the reservoir tank cap is tightened.

Flushing

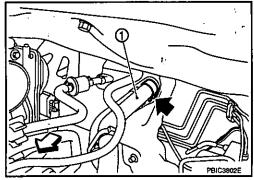

INFOID:0000000004899438

Install reservoir tank if removed, and connect radiator hose (lower).
 If water drain plugs on cylinder block are removed, close and tighten them. Refer to <u>EM-94</u>.
 "Exploded View".

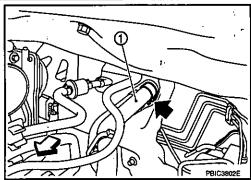

Disconnect heater hose (1) at position ( ) in the figure.

: Vehicle front

• Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

- 3. Fill reservoir tank with water.
  - When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.
- 4. Install reservoir tank cap.
- 5. Run the engine and warm it up to normal operating temperature.
- 6. Rev the engine two or three times under no-load.
- 7. Stop the engine and wait until it cools down.
- 8. Drain water from the system. Refer to CO-9, "Draining".
- 9. Repeat steps 1 through 8 until clear water begins to drain from radiator.
- 10. Check that the reservoir tank cap is tightened.

# RADIATOR RESERVOIR TANK CAP

# RESERVOIR TANK CAP: Inspection

INFOID:0000000004899439

- Fit the adapter to the reservoir tank cap tester [SST: (M.S. 554-07)] (A) as shown.
- When connecting the reservoir tank cap to the reservoir tank cap tester, apply water or LLC to the reservoir tank cap seal part.
- Check reservoir tank cap relief pressure.

#### Standard: Refer to CO-23, "Radiator".

 Replace the reservoir tank cap if the engine coolant passes through it, or if any fur signs is detected.

#### **CAUTION:**

When installing reservoir tank cap, thoroughly wipe out the reservoir tank filler neck to remove any waxy residue or foreign material.

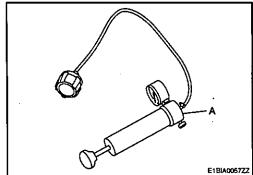

**RADIATOR** 

INFOID:0000000004899440

Check radiator for mud or clogging. If necessary, clean radiator as follows. **CAUTION:** 

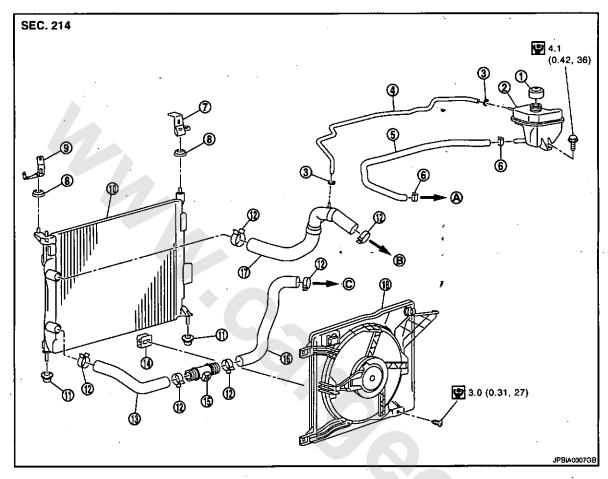

- Be careful not to bend or damage radiator fins.
- When radiator is cleaned without removal, remove all surrounding parts such as radiator cooling fan assembly and horns. Then tape harness and connectors to prevent water from entering.
- 1. Apply water by hose to the back side of the radiator core vertically downward.
- 2. Apply water again to all radiator core surfaces once per minute.
- 3. Stop washing if any stains no longer flow out from radiator.
- 4. Blow air into the back side of radiator core vertically downward.
  - Use compressed air lower than 490 kPa (5 kg/cm<sup>2</sup>, 71 psi) and keep distance more than 30 cm (11.8 in).
- 5. Blow air again into all the radiator core surfaces once per minute until no water sprays out.

#### < ON-VEHICLE REPAIR >

- Remove air duct (inlet). Refer to <u>EM-28. "Exploded View"</u>.
- 3. Remove reservoir tank hose at radiator hose (upper) side.
- 4. Disconnect connector from resistor and fan motor, and move harness to aside.
- 5. Remove cooling fan assembly. Refer to CO-15, "Exploded View". CAUTION:

Be careful not to damage radiator core.

- 6. Remove radiator hose (upper and lower).
- 7. Remove liquid tank bracket mounting bolts. Refer to HA-50. "Exploded View".
- 8. Remove mounting bracket (upper).
- 9. Lift up the A/C condenser to disengage the radiator, and then remove the radiator. **CAUTION:**

Be careful not to damage or scratch radiator and A/C condenser core.

#### INSTALLATION

Installation is the reverse order of removal.

### Inspection

INFOID:0000000004899443

#### INSPECTION AFTER INSTALLATION

- · Check that the reservoir tank cap is tightened.
- Check for leaks of engine coolant using the adapter and the reservoir tank cap tester [SST: (M.S. 554-07)]. Refer to <u>CO-9. "Inspection"</u>.
- Start and warm up the engine. Visually check that there is no leaks of engine coolant.

# **COOLING FAN**

**Exploded View** 

INFOID:0000000004899444

Cooling fan

2. Fan motor

3. Fan shroud

- Resistor
- A. Reverse screw
- (L): Apply thread locking sealant.

: Vehicle front

Refer to GI-3. "Components" for symbols not described on the above.

#### Removal and Installation

INFOID:0000000004899445

#### REMOVAL

- Remove air duct (inlet). Refer to <u>EM-28</u>, "Exploded View".
- Disconnect harness connector from resistor and fan motor, and move harness to aside.
- Remove cooling fan assembly.

**CAUTION:** 

Be careful not to damage or scratch on radiator core.

#### **INSTALLATION**

Note the following, and install in the reverse order of removal.

#### **CAUTION:**

Only use genuine parts for fan shroud mounting bolt and observe the specified torque (to prevent radiator from being damaged).

NOTE:

Cooling fan is controlled by ECM.

### Disassembly and Assembly

INFOID:0000000004899448

**DISASSEMBLY** 

1. Remove resistor from fan shroud.

**CAUTION:** 

Handle carefully to avoid dropping and shocks.

Remove cooling fan mounting nuts, and then remove the cooling fan.

**CAUTION:** 

Reverse screw is used for the fan attachment nut. When removing or attaching, turn the screw the opposite way as for a normal screw.

3. Remove fan motor.

#### **ASSEMBLY**

Assembly is the reverse order of disassembly.

· Apply thread locking sealant on fan motor shaft.

Inspection

INFOID:0000000004899447

#### INSPECTION AFTER DISASSEMBLY

#### Cooling Fan

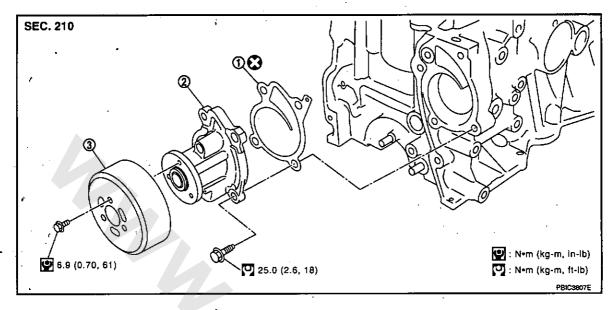

Inspect cooling fan for crack or unusual bend.

· If anything is found, replace cooling fan.

## **WATER PUMP**

# **Exploded View**

(NFOID:000000004899448

1. Gasket

2. Water pump

3. Water pump pulley

Refer to GI-3, "Components" for symbols in the figure.

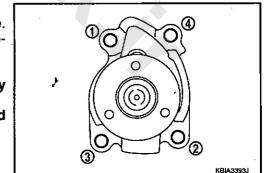

#### Removal and Installation

#### REMOVAL

- Drain engine coolant from radiator. Refer to <u>CO-9, "Draining"</u>. CAUTION:
  - · Perform this step when the engine is cold.
  - Never spill engine coolant on drive belts.
- 2. Steer front wheel to the right.
- 3. Remove front fender protector (RH). Refer to fender protector.
- 4. Loosen mounting boits of water pump pulley before loosening belt tension of drive belt.
- Remove drive belt. Refer to <u>EM-17</u>, "Removal and Installation".
- 6. Remove water pump pulley.
- 7. Remove water pump.
  - Loosen mounting bolts in reverse order as shown in the figure.
  - Engine coolant will leak from cylinder block, so have a receptacle ready below.

#### **CAUTION:**

- Handle water pump vane so that it does not contact any other parts.
- Water pump cannot be disassemble and should replaced as a unit.

#### INSTALLATION

Note the following, and install in the reverse order of removal.

# Inspection

#### INSPECTION AFTER REMOVAL

- Visually check if there is no significant dirt or rusting on water pump body and vane (A).
- Check that there is no looseness in vane shaft, and that it turns smoothly when rotated by hand.
- Replace water pump, if necessary.

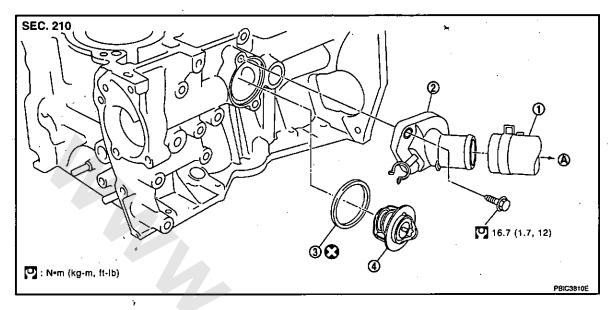

#### INSPECTION AFTER INSTALLATION

- Check that the reservoir tank cap is tightened.
- Check for leaks of engine coolant using the adapter and the reservoir tank cap tester [SST: (M.S. 554-07)]. Refer to CO-9, "Inspection".
- Start and warm up the engine. Visually check that there is no leaks of engine coolant.

- Install thermostat (2) with jiggle valve (A) facing upwards.
  - 1 : Cylinder block

#### Water Inlet

After installation, fix water inlet clip (A) on the oil level gauge guide (1) as shown in the figure.

B : Positioning

## Inspection

#### INFOID:0000000004899453

#### INSPECTION AFTER REMOVAL

#### **WARNING:**

Use a protector to prevent a burn during the work.

#### Thermostat

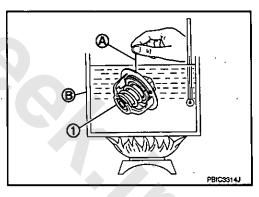

- Place a thread (A) so that it is caught in the valves of thermostat (1). Immerse fully in a container (B) filled with water. Heat while stirring.
- The valve opening temperature is the temperature at which the valve opens and falls from the thread.
- Continue heating. Check the full open valve lift amount.
- After checking the maximum valve lift amount, lower the water temperature and check the valve closing temperature.

#### Standard: Refer to CO-23, "Thermostat".

If out of the standard, replace thermostat.

#### INSPECTION AFTER INSTALLATION

- · Check that the reservoir tank cap is tightened.
- Check for leaks of engine coolant using the adapter and the reservoir tank cap tester [SST: (M.S. 554-07)]. Refer to CO-9, "Inspection".
- · Start and warm up the engine. Visually check that there is no leaks of engine coolant.

# **PRECAUTION**

## **PRECAUTIONS**

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the "SRS AIR BAG" and "SEAT BELT" of this Service Manual.

#### **WARNING:**

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the "SRS AIR BAG".
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

#### **WARNING:**

- When working near the Air Bag Diagnosis Sensor Unit or other Air Bag System sensors with the ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.
- When using air or electric power tools or hammers, always switch the ignition OFF, disconnect the battery, and wait at least 3 minutes before performing any service.

Precaution Necessary for Steering Wheel Rotation After Battery Disconnect

INFOID:0000000004956918

#### NOTE:

- This Procedure is applied only to models with Intelligent Key system and NATS (NISSAN ANTI-THEFT SYS-TEM).
- Remove and install all control units after disconnecting both battery cables with the ignition knob in the "LOCK" position.

For models equipped with the Intelligent Key system and NATS, an electrically controlled steering lock mechanism is adopted on the key cylinder.

For this reason, if the battery is disconnected or if the battery is discharged, the steering wheel will lock and steering wheel rotation will become impossible.

If steering wheel rotation is required when battery power is interrupted, follow the procedure below before starting the repair operation.

#### OPERATION PROCEDURE

1. Connect both battery cables.

#### NOTE:

Supply power using jumper cables if battery is discharged.

- 2. Use the Intelligent Key or mechanical key to turn the ignition switch to the "ACC" position. At this time, the steering lock will be released.
- 3. Disconnect both battery cables. The steering lock will remain released and the steering wheel can be rotated.
- 4. Perform the necessary repair operation.
- 5. When the repair work is completed, return the ignition switch to the "LOCK" position before connecting the battery cables. (At this time, the steering lock mechanism will engage.)

# ON-VEHICLE MAINTENANCE ENGINE COOLANT

# Inspection

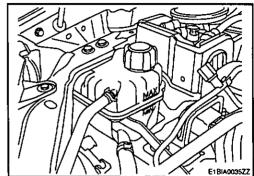

#### INFOID:0000000004899467

#### **LEVEL**

- Check if the reservoir tank engine coolant level is within the "MIN" to "MAX" when the engine is cool.
- Adjust the engine coolant level as necessary.
- Check that the reservoir tank cap is tightened.

#### WARNING:

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

#### **LEAKAGE**

 To check for leakage, fit the adapter to the reservoir tank, and then connect it to the reservoir tank cap tester [SST: — (M.S.554-07)]
 (A) as shown.

Testing pressure: Refer to CO-46. "Radiator".

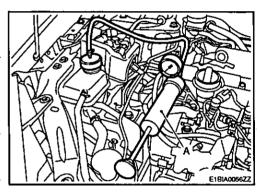

#### WARNING:

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

#### **CAUTION:**

Higher test pressure than specified may cause radiator damage.

If anything is found, repair or replace damaged parts.

# Draining

#### **WARNING:**

- Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.
- Wrap a thick cloth around the reservoir tank cap. Slowly turn it a quarter of a turn to release built-up pressure. Then turn it all the way.
- Disconnect radiator hose (lower) and reservoir tank cap.

When draining all of engine coolant in the system, open water drain plugs on cylinder block. Refer to EM-213. "Disassembly and Assembly".

#### **CAUTION:**

- Perform this step when engine is cold.
- Never spill engine coolant on drive belt.
- 2. Remove reservoir tank if necessary, and drain engine coolant and clean reservoir tank before installing.
  - Remove of engine mounting insulator (RH) is necessary. Refer to <u>EM-196, "M/T : Exploded View"</u> (M/T models) or <u>EM-201, "CVT : Exploded View"</u> (CVT models).
- 3. Check drained engine coolant for contaminants such as rust, corrosion or discoloration. If contaminated, flush the engine cooling system. Refer to CO-31, "Flushing".

### Refilling

INFOID:0000000004899469

INFOID:0000000004899468

- Install reservoir tank if removed.
- Connect radiator hose (lower).

If water drain plugs on cylinder block are removed, close and tighten them. Refer to <u>EM-213</u>, "<u>Disassembly and Assembly"</u>.

CO

C

D

E

G

H

K

L

M

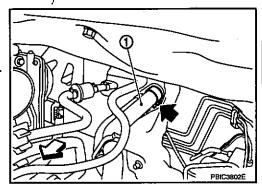

Ν

0

- Check that each hose clamp has been firmly tightened.
- Disconnect heater hose (1) at position (←) in the figure.

⟨⇒ : Vehicle front

 Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

Fill reservoir tank to specified level.

 Pour coolant slowly of less than 2 \( \ell \) (1-3/4 lmp qt) a minute to allow air in system to escape.

 When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.

Start engine without closing reservoir tank cap.

 Keep engine racing at 1,500 rpm for about 2-3 minutes, filling reservoir tank up to MAX. Level, if necessary.

 Use Genuine NISSAN Engine Coolant or equivalent mixed with water (distilled or demineralized). Refer to MA-13, "Fluids and Lubricants"

Engine coolant capacity

(With reservoir tank at "MAX" level)

Refer to :CO-46, "Periodical Maintenance Specification"

Reservoir tank engine coolant capacity (At "MAX" level)

Refer to CO-46, "Periodical Maintenance Specification".

- 6. Install reservoir tank cap.
- 7. Warm up engine until opening thermostat. Standard for warming-up time is approximately 10 minutes at 2,000 2,500 rpm.
  - Check thermostat opening condition by touching radiator hose (lower) to see a flow of warm water.
     CAUTION:

Watch water temperature gauge so as not to overheat engine.

- Stop the engine and cool down to less than approximately 50°C (122°F).
  - Cool down using fan to reduce the time.
- Refill reservoir tank to "MAX" level line with engine coolant, if necessary.
- 10. Repeat steps 6 through 9 two or more times with reservoir tank cap installed until reservoir tank level no longer drops.
- 11. Check cooling system for leaks with engine running.
- 12. Warm up the engine, and check for sound of engine coolant flow while running engine from idle up to 3,000 rpm with heater temperature controller set at several position between "COOL" and "WARM".
  - Sound may be noticeable at heater unit.
- 13. Repeat step 12 three times.
- 14. If sound is heard, bleed air from cooling system by repeating step 6 through 9 until reservoir tank level no longer drops.
- 15. Check that the reservoir tank cap is tightened.

Flushing

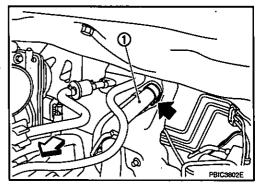

INFOID:000000004899470

1. Install reservoir tank if removed, and connect radiator hose (lower).

CO-31

If water drain plugs on cylinder block are removed, close and tighten them. Refer to EM-213, "Disassembly and Assembly".

- 2. Disconnect heater hose (1) at position ( ) in the figure.
  - ⟨□ : Vehicle front
  - Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

- Fill reservoir tank with water.
  - When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.
- 4. Install reservoir tank cap.
- 5. Run the engine and warm it up to normal operating temperature.
- 6. Rev the engine two or three times under no-load.
- 7. Stop the engine and wait until it cools down.
- 8. Drain water from the system. Refer to CO-30, "Draining".
- 9. Repeat steps 1 through 8 until clear water begins to drain from radiator.
- Check that the reservoir tank cap is tightened.

INFOID:000000000489947

INFOID:0000000004899472

# RADIATOR RESERVOIR TANK CAP

# RESERVOIR TANK CAP: Inspection

 Fit the adapter to the reservoir tank cap tester [SST: — (M.S.554-07)] (A) as shown.

 When connecting the reservoir tank cap to the reservoir tank cap tester, apply water or LLC to the reservoir tank cap seal part.

Check reservoir tank cap relief pressure.

#### Standard: Refer to CO-46, "Radiator".

• Replace the reservoir tank cap if the engine coolant passes through it, or if any fur signs is detected.

#### **CAUTION:**

When installing reservoir tank cap, thoroughly wipe out the reservoir tank filler neck to remove any waxy residue or foreign material.

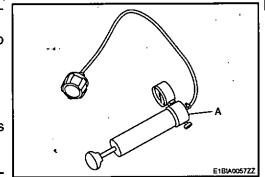

**RADIATOR** 

## **RADIATOR**: Inspection

Check radiator for mud or clogging. If necessary, clean radiator as follows. **CAUTION:** 

· Be careful not to bend or damage radiator fins.

- When radiator is cleaned without removal, remove all surrounding parts such as radiator cooling fan assembly and horns. Then tape harness and connectors to prevent water from entering.
- 1. Apply water by hose to the back side of the radiator core vertically downward.
- 2. Apply water again to all radiator core surfaces once per minute.
- 3. Stop washing if any stains no longer flow out from radiator.
- 4. Blow air into the back side of radiator core vertically downward.
  - Use compressed air lower than 490 kPa (5 kg/cm<sup>2</sup>, 71 psi) and keep distance more than 30 cm (11.8 in).
- 5. Blow air again into all the radiator core surfaces once per minute until no water sprays out.

Cooling fan

Fan motor

Fan shroud

- Resistor
- A. Reverse screw

Apply thread locking sealant.

∵ : Vehicle front

Refer to GI-3, "Components" for symbols not described on the above.

#### Removal and Installation

REMOVAL

- 1. Remove air duct (inlet). Refer to EM-146. "Exploded View".
- 2. Disconnect harness connector from resistor and fan motor, and move harness to aside.
- Remove cooling fan assembly.

**CAUTION:** 

Be careful not to damage or scratch on radiator core.

#### INSTALLATION

Note the following, and install in the reverse order of removal.

**CAUTION:** 

Only use genuine parts for fan shroud mounting bolt and observe the specified torque (to prevent radiator from being damaged). (M/T models)

NOTE:

Cooling fan is controlled by ECM. For details, refer to EC-52, "System Diagram".

# Disassembly and Assembly

INFOID:0000000004899478

INFOID:0000000004899477

DISASSEMBLY

#### < ON-VEHICLE REPAIR >

1. Remove resistor from fan shroud.

**CAUTION:** 

Handle carefully to avoid dropping and shocks.

2. Remove cooling fan mounting nut, and then remove the cooling fan.

**CAUTION:** 

Reverse screw is used for the fan attachment screw. When removing or attaching, turn the screw the opposite way as for a normal screw.

3. Remove fan motor.

#### **ASSEMBLY**

Assembly is the reverse order of disassembly.

· Apply thread locking sealant on fan motor shaft.

### Inspection

INFOID:0000000004899479

# INSPECTION AFTER DISASSEMBLY

#### Cooling Fan

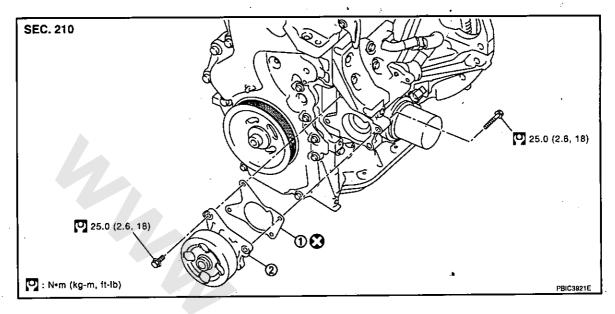

Inspect cooling fan for crack or unusual bend.

· If anything is found, replace cooling fan.

# **WATER PUMP**

# **Exploded View**

INFOID:0000000004899480

1. Gasket

2. Water pump

Refer to GI-3, "Components" for symbols in the figure.

### Removal and Installation

#### REMOVAL

- Drain engine coolant from radiator. Refer to <u>CO-30, "Draining"</u>. CAUTION:
  - · Perform this step when the engine is cold.
  - Never spill engine coolant on drive belts.
- 2. Remove front fender protector (RH). Refer to EXT-22, "Exploded View".
- 3. Remove drive belt. Refer to EM-136, "Removal and Installation".
- 4. Remove water pump.
  - Engine coolant will leak from cylinder block, so have a receptacle ready below.

#### **CAUTION:**

- Handle water pump vane so that it does not contact any other parts.
- · Water pump cannot be disassemble and should replaced as a unit.

#### INSTALLATION

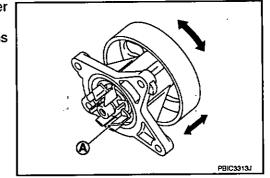

Install in the reverse order of removal.

#### Inspection

#### INFOID:0000000004899482

#### INSPECTION AFTER REMOVAL

- Visually check if there is no significant dirt or rusting on water pump body and vane (A).
- Check that there is no looseness in vane shaft, and that it turns smoothly when rotated by hand.
- · Replace water pump, if necessary.

# PRECAUTION

## PRECAUTIONS

Precaution for Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

CO

Α

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a front seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. This system includes seat belt switch inputs and dual stage front air bag modules. The SRS system uses the seat belt switches to determine the front air bag deployment, and may only deploy one front air bag, depending on the severity of a collision and whether the front occupants are belted or unbelted. Information necessary to service the system safely is included in the "SRS AIR BAG" and "SEAT BELT" of this Service Manual.

D

**WARNING:** 

E

· To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance must be performed by an authorized NISSAN/INFINITI dealer.

· Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the "SRS AIR BAG".

 Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harnesses or harness connectors.

PRECAUTIONS WHEN USING POWER TOOLS (AIR OR ELECTRIC) AND HAMMERS

Н

#### WARNING:

· When working near the Air Bag Diagnosis Sensor Unit or other Air Bag System sensors with the ignition ON or engine running, DO NOT use air or electric power tools or strike near the sensor(s) with a hammer. Heavy vibration could activate the sensor(s) and deploy the air bag(s), possibly causing serious injury.

J

· When using air or electric power tools or hammers, always switch the ignition OFF, disconnect the battery, and wait at least 3 minutes before performing any service.

Precaution Necessary for Steering Wheel Rotation After Battery Disconnect

INFOID:0000000004956920

### NOTE:

This Procedure is applied only to models with Intelligent Key system and NATS (NISSAN ANTI-THEFT SYS-

· Remove and install all control units after disconnecting both battery cables with the ignition knob in the "LOCK" position.

For models equipped with the Intelligent Key system and NATS, an electrically controlled steering lock mechanism is adopted on the key cylinder.

For this reason, if the battery is disconnected or if the battery is discharged, the steering wheel will lock and steering wheel rotation will become impossible.

If steering wheel rotation is required when battery power is interrupted, follow the procedure below before starting the repair operation.

#### OPERATION PROCEDURE

0

Connect both battery cables.

NOTE:

2. Use the Intelligent Key or mechanical key to turn the ignition switch to the "ACC" position. At this time, the

steering lock will be released. Disconnect both battery cables. The steering lock will remain released and the steering wheel can be

rotated. Perform the necessary repair operation.

Supply power using jumper cables if battery is discharged.

5. When the repair work is completed, return the ignition switch to the "LOCK" position before connecting the battery cables. (At this time, the steering lock mechanism will engage.)

#### **LEVEL**

- · Check if the reservoir tank engine coolant level is within the "MIN" to "MAX" when the engine is cool.
- Adjust the engine coolant level as necessary.
- · Check that the reservoir tank cap is tightened.

#### **WARNING:**

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

#### **LEAKAGE**

• To check for leakage, fit the adapter to the reservoir tank, and then connect it to the reservoir tank cap tester [SST: - (M.S.554-07)] (A) as shown.

Testing pressure: Refer to CO-68, "Radiator".

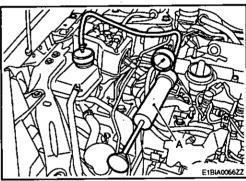

#### **WARNING:**

Never remove reservoir tank cap when engine is hot. Serious burns could occur from high-pressure engine coolant escaping from reservoir tank.

**CAUTION:** 

Higher test pressure than specified may cause radiator dam-

· If anything is found, repair or replace damaged parts.

# Draining

#### **WARNING:**

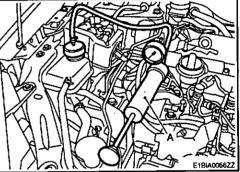

- · Never remove reservoir tank cap when engine is hot. Serious burns may occur from high-pressure engine coolant escaping from radiator and reservoir tank.
- Wrap a thick cloth around the caps. Slowly turn it a quarter of a turn to release built-up pressure. Then turn it all the way.
- 1. Remove engine undercover.
- 2. Disconnect radiator hose (lower), and then remove reservoir tank cap. Refer to CO-57, "Exploded View". CAUTION:

Perform this step when engine is cold.

- 3. Remove reservoir tank if necessary, and drain engine coolant and clean reservoir tank before installing. Removal of engine mounting insulator (RH) is necessary. Refer to EM-315. "Exploded View".
- Check drained engine coolant for contaminants such as rust, corrosion or discoloration. If contaminated, flush the engine cooling system. Refer to CO-54, "Flushing".

# Refilling

- 1. Install reservoir tank if removed.
- 2. Connect radiator hose (lower). Refer to CO-57, "Exploded View".
- Check that each hose clamp has been firmly tightened.

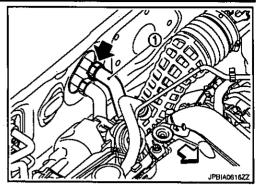

М

Ν

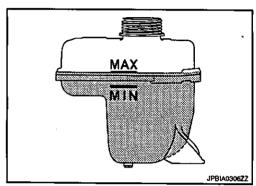

Disconnect heater hose (1) at position ( in the figure.

⟨□ : Vehicle front

 Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

- Fill reservoir tank to specified level.
  - Pour coolant slowly of less than 2 ℓ (1-3/4 lmp qt) a minute to allow air in system to escape.
  - When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.
  - · Start engine without closing reservoir tank cap.
  - Keep engine racing at 1,500 rpm for about 2-3 minutes, filling reservoir tank up to MAX. Level, if necessary.
  - Use Genuine NISSAN Engine Coolant or equivalent mixed with water (distilled or demineralized). Refer to MA-13, "Fluids and Lubricants".

Engine coolant capacity

(With reservoir tank at "MAX" level)

Refer to CO-68. "Periodical Maintenance Specification".

Reservoir tank engine coolant capacity (At "MAX" level)

Refer to: CO-68, "Periodical Maintenance Specification".

- Install reservoir tank cap.
- Warm up engine until opening thermostat. Standard for warming-up time is approximately 10 minutes at 2,000 - 2,500 rpm.
  - Check thermostat opening condition by touching radiator hose (lower) to see a flow of warm water.

**CAUTION:** 

Watch water temperature gauge so as not to overheat engine.

- 8. Stop the engine and cool down to less than approximately 50°C (122°F).
  - Cool down using fan to reduce the time.
- 9. Refill reservoir tank to "MAX" level line with engine coolant, if necessary.
- Repeat steps 6 through 9 two or more times with reservoir tank cap installed until reservoir tank level no longer drops.
- 11. Check cooling system for leaks with engine running.
- 12. Warm up the engine, and check for sound of engine coolant flow while running engine from idle up to 3,000 rpm with heater temperature controller set at several position between "COOL" and "WARM".

Sound may be noticeable at heater unit.

- Repeat step 12 three times.
- 14. If sound is heard, bleed air from cooling system by repeating step 6 through 9 until reservoir tank level no longer drops.
- 15. Check that the reservoir tank cap is tightened.

### Flushing

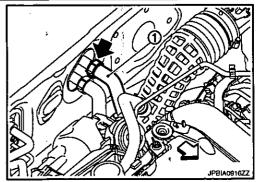

INFOID:0000000004899504

- 1. Install reservoir tank if removed.
- Connect radiator hose (lower). Refer to <u>CO-57</u>. "Exploded View".

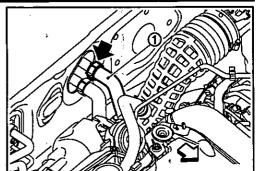

Disconnect heater hose (1) at position ( in the figure.

: Vehicle front

• Enhance heater hose as high as possible, keeping heater hose end above reservoir tank MAX level.

- Fill reservoir tank with water.
  - · When coolant from heater unit starts to drain, connect heater hose and continue to fill up to reservoir tank MAX level.
- 5. Install reservoir tank cap.
- 6. Run the engine and warm it up to normal operating temperature.
- Rev the engine two or three times under no-load.
- 8. Stop the engine and wait until it cools down.
- 9. Drain water from the system. Refer to CO-53. "Draining".
- 10. Repeat steps 1 through 9 until clear water begins to drain from radiator.
- 11. Check that the reservoir tank cap is tightened.

## **RADIATOR**

## RESERVOIR TANK CAP

# RESERVOIR TANK CAP: Inspection

INFOID:0000000004899505

- Fit the adapter to the reservoir tank cap tester [SST: (M.S. 554-07)] (A) as shown.
- When connecting the reservoir tank cap to the reservoir tank cap tester, apply water or LLC to the reservoir tank cap seal part.
- Check reservoir tank cap relief pressure.

#### Standard: Refer to CO-68, "Radiator".

• Replace the reservoir tank cap if the engine coolant passes through it, or if any fur signs is detected.

#### **CAUTION:**

When installing reservoir tank cap, thoroughly wipe out the reservoir tank filler neck to remove any waxy residue or foreign material.

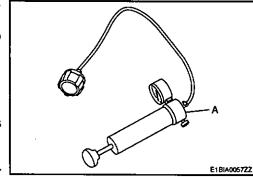

RADIATOR

INFOID:000000004898506

Check radiator for mud or clogging. If necessary, clean radiator as follows. **CAUTION:** 

- Be careful not to bend or damage radiator fins.
- When radiator is cleaned without removal, remove all surrounding parts such as radiator cooling fan assembly and horns. Then tape harness and connectors to prevent water from entering.
- 1. Apply water by hose to the back side of the radiator core vertically downward.
- Apply water again to all radiator core surfaces once per minute.
- 3. Stop washing if any stains no longer flow out from radiator.
- 4. Blow air into the back side of radiator core vertically downward.
  - Use compressed air lower than 490 kPa (4.9 bar, 5 kg/cm<sup>2</sup>, 71 psi) and keep distance more than 30 cm (11.8 in).
- 5. Blow air again into all the radiator core surfaces once per minute until no water sprays out.

#### REMOVAL

#### **WARNING:**

- Never remove reservoir tank cap when engine is hot. Serious burns may occur from high-pressure engine coolant escaping from radiator and reservoir tank.
- · Wrap a thick cloth around the caps. Slowly turn it a quarter of a turn to release built-up pressure. Then turn it all the way.

- Remove engine undercover.
- 2. Drain engine coolant from radiator. Refer to CO-53, "Draining".

### CAUTION:

Perform this step when the engine is cold.

- 3. Remove air duct (inlet). Refer to EM-265, "Exploded View".
- 4. Remove front grille and air guide. Refer to EXT-18, "Exploded View".
- 5. Remove air inlet hose, air inlet pipe and bracket. Refer to EM-268, "Exploded View".
- 6. Remove liquid tank pipe fixing screw from radiator right side. Refer to HA-50. "Exploded View".
- Remove mounting bracket and mounting rubber (upper).
- 8. Disconnect harness connector from resistor and fan motors, and move harness to aside.
- 9. Disconnect radiator hose (upper).
- 10. Remove cooling fan assembly.

**CAUTION:** 

Be careful not to damage radiator core when removing.

- 11. Disconnect reservoir tank hose (upper) from radiator.
- 12. Disconnect radiator hose (lower).
- 13. Remove radiator.

CAUTION:

Be careful not to damage or scratch radiator core.

#### INSTALLATION

Installation is the reverse order of removal.

### Inspection

INFOID:000000000489950

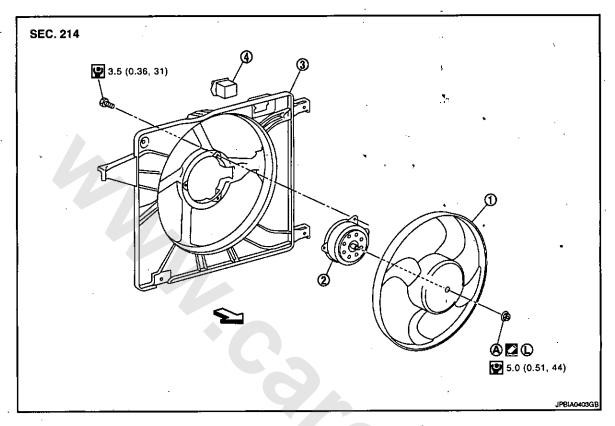

#### INSPECTION AFTER INSTALLATION

- Check that the reservoir tank cap is tightened.
- Check for leaks of engine coolant using the adapter and the reservoir tank cap tester [SST: (M.S. 554-07)]. Refer to CO-53, "Inspection".
- Start and warm up the engine. Visually check that there is no leaks of engine coolant.
